OverviewTypes of lead-acid deep-cycle batteryNew technologiesApplicationsRecyclingExternal linksThe structural difference between deep-cycle and cranking lead-acid batteries is in the lead battery plates. Deep-cycle battery plates have thicker active plates, with higher-density active paste material and thicker separators. Alloys used for the plates in a deep-cycle battery may contain more antimony than that of starting batteries. The thicker battery plates resist corrosion through extended charge and discharge cycles.

To the untrained eye, deep-cycle batteries may look identical to car batteries, but in reality, they are very different.

This article explores two prominent options: tubular batteries (a type of lead-acid battery) and lithium batteries (primarily lithium iron phosphate, or LiFePO₄, for solar applications).

DEEP definition: extending far down from the top or surface. See examples of deep used in a sentence.
