A European team of researchers is developing modular wind-solar hybrid and tilting wing wind power technology to reduce fuel consumption of long-distance cargo vessels in a three-year...

Discover how electric ferries, suction sails, and solar, wind, and hydrogen technologies are revolutionizing maritime transport.

Windcoop has turned Turkey's RMK Marine to build the first open-hatch, sail-powered cargo ship. The vessel, designed to integrate wind propulsion with efficient container handling, marks ...

Battery-electric ships, wind-assisted propulsion, and solar-powered vessels are no longer prototypes or novelties. They are operational, investable, and increasingly essential to meeting both ...

Wind-powered cargo ships use wind energy to complement or even partially replace traditional fossil fuel combustion. This approach holds the potential to greatly reduce greenhouse gas ...

Most of the activity involves new high-tech energy harvesting devices that reduce carbon emissions -- and save money -- by supplementing conventional fuel. However, some maritime ...

Advanced wind-propulsion systems that can be retrofitted onto existing ships hold the potential to provide substantial energy and fuel-saving benefits, but are they really the future of the ...

TESUP's wind turbines and flexible solar panels represent the pinnacle of renewable energy technology. The wind turbines are designed to be highly efficient even in low wind conditions, ...

The concept of using wind and solar power together on ships is not science fiction, nor is it decades away. Eco Marine Power has completed lab tests of the EnergySail along with the EnergySail ACS, ...

Foreign solar and wind energy cabinet ships

This blog post explores how wind and solar energy are reshaping the future of shipping, the key technologies driving these changes, and the challenges that lie ahead.
