---

As mobile communication continues to evolve, the ability for direct device-to-device (D2D) communication has become crucial in LTE-Advanced Pro and 5G networks. This feature, ...

While a device is in the connected state, data can be sent directly to the device's assigned cellular tower without any need to negotiate with the RRC. This remains true as long as the device is ...

No, it is not possible for one cell phone to communicate directly with another. Not for any physical reason of signal strength, but because the protocol design relies on cell towers playing an active role. ...

In long term evolution (LTE) cellular networks, the devices present in close proximity can communicate directly without going through the base station. This tec

These networks are composed of interconnected cells, each served by a base station. When a mobile device enters a cell, it communicates with the base station, allowing data to be transmitted and ...

In LTE-Direct, D2D communication-enabled devices can interact with each other using a secure transmission protocol similar to the devices communicate with the base station.

Motorola demonstrated how LTE can accelerate the delivery of personal media experience with HD video demo streaming, HD video blogging, Online gaming, and VoIP over LTE running a RAN ...

4G LTE device to device, D2D communications is a mode mainly intended for emergency services and other similar applications tat allows two LTE devices to communicate directly with each other without ...

LTE Mobile communicates with just one base station and one cell at a time and there are following two main functions supported by eNB: The eBN sends and receives radio transmissions to all the ...

## Lte communicates directly without going through base station

Unlike HSPA, LTE's E-UTRA is an entirely new air interface system. It provides higher data rates, lower latency and is optimized for packet data. EUTRAN (Evolved Universal Terrestrial Radio) consists of ...
