---

The Yangtze corridor is emerging as the world's largest clean-energy trade route, powered by HVDC, solar, and battery-electric vessels.

This study provides policy makers and potential investors with information on solar energy potential in the Yangtze River Delta region that would contribute to solar power generation development.

By 2030, the results indicate that the rooftop area in the Yangtze River Delta urban agglomeration will have increased by 1.11 times, the useable rooftop area will expand by 338 square ...

Therefore, the objective of this study is to perform a comprehensive assessment of the solar energy potential in the Yangtze River Delta region using high-resolution solar radiation data and the best ...

This research performs a geographic information systems (GIS)-based assessment of the solar energy potential in the Yangtze River Delta region (YRDR) of China using high-resolution solar radiation ...

This study provides policy makers and potential investors with information on solar energy potential in the Yangtze River Delta region that would contribute to solar power generation

solar photovoltaic power generation has steadily increased. With the rising share of renewable power, its intrinsic intermittence and fluctuation supply characteristics, the power system is bound to have a ...

Combining the rich water resources in the upper reaches of the Yangtze River and the geographical advantages of hills, it is feasible to explore a joint development mode of wind power, solar power ...

The research findings confirm the application potential of new energy sources in the Yangtze River Economic Belt and quantify the emission reduction effects of new environmental ...

# Solar power generation on the Yangtze River is feasible

Many new-energy-powered vessels, such as pure electric, hydrogen-fueled and LNG-fueled ships, have been built and are now operating throughout the Yangtze River Basin.
