-----

But as solar panels degrade, they become far less efficient, and eventually stop working altogether. The obvious solution might be to recycle all those solar panels, but it's not that...

Solar panel recycling is still fairly new because there hasn't yet been a great volume of panels that have reached the end of their useful life. As more panels reach the end of their life, ...

Although labeled as "clean energy," solar panels harbor a cocktail of toxic chemicals, including cadmium compounds, silicon tetrachloride, hexafluoroethane and lead.

Though solar energy is viable for homes in sunny locations such as California, placing solar energy systems in Alaska or the North Pole would be a colossal waste of resources, energy, and time.

Three years ago I published a column at Forbes arguing that solar panels weren't clean but in fact produced 300 times more toxic waste than high-level nuclear waste.

Articles often note that solar panels will be "useless at night and in winter". The fact that solar panels need the sun to generate power is a statement of the obvious. Moreover, this argument ...

The truth is that solar panels harness the sun's radiation energy, not its temperature. What is more, they even work better in climates with lower year-round temperatures, since electrical conductivity is ...

That is just another example of the fake claims that surround every aspect of residential solar power. The premise behind solar power is that it does not generate CO<sub>2</sub> and thus helps ...

The potential impacts of solar photovoltaic electricity begin with the materials used to make solar panels and continue through their full life cycle -- from manufacture to disposal.

The long life span of solar panels also serves to disincentivize innovation in this area. As a result, solar's

# Useless solar photovoltaic panels

production boom has left its recycling infrastructure in the dust.
